

# ANGUS 1

## Lolium multiflorum westerwoldicum

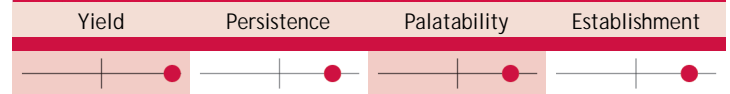

## Annual Ryegrass

Highly palatable with excellent yields

- Superior yields
- Excellent palatability
- Very vigorous
- Rapid establishment

### High Performances

### Quick Facts

ANGUS 1 is a tetraploid annual ryegrass that has larger leaves, a higher water content, and better palatability than

many diploid varieties. Angus 1 will produce high quality feed for use as pasture, hay or silage. It was bred for vigor, disease resistance and high performance. It is highly resistant to the major forage diseases including crown and leaf rust, leaf spot/scald, powdery mildew and pythium blight.

ANGUS 1 produces excellent succulent long-term grazing if sown alone or in combination with fall-sown small grains and annual clovers. Angus 1 is a new generation ryegrass with exceptional plant vigor, forage yielding ability, stress tolerance and disease resistance.
