

# GINGER

## Poa pratensis

## Kentucky Blugrass

### Rating

GINGER is an early season Kentucky bluegrass that will produce very high yields. It is tolerant of close grazing, palatable and nutritious for all livestock - especially horses. It will spread aggressively by rhizomes and boasts a leaf width and length nearly twice that of other bluegrasses. Ginger creates excellent cover with a low percentage of weeds. For early spring green-up, count on Ginger.

GINGER exhibits exceptional plant vigor, forage yielding ability, stress tolerance and disease resistance. A very early variety that performs well under various grazing regimes.

- High yields
- Medium density
- Disease resistant
- Early heading
