

Martin 2

festuca arundinacea

Tall fescue

Rating

Quick Facts

MARTIN II is an early flowering, endophyte-free, winter dormant (European) and non-winter dormant (Mediterranean) hybrid derivative, long lived perennial bunchgrass. Martin 2 exhibits excellent seedling vigor and provides extended stay-green forage production during mild summers. Martin 2 is deep rooted, tolerates soil acidity, high bulk density soils, poor drainage and is relatively tolerant of drought. Martin 2 has been tested extensively in domestic and international forage circles.

- High yields
- Very digestible
- Drought tolerant
- Good re-growth
